

Causey District-Ready Site Audit

Verdict

Chess discovery and assisted district pilot workflows are real and mostly honest. A for-profit, self-serve district product is not ready. Buyers would get operational capability after being provisioned, but the public storefront, legal trust surface, email delivery, and coach↔admin permission split are not at sale quality.

Account model & route map

Three personal roles (student / parent / coach) land on `/me`, `/family`, `/orgs`. School and district power is granted through org membership, not a separate signup persona. Platform admin is orthogonal, at `/admin`.

1 Signed-out visitor

Done properly

- Home + `/chess` are discovery-first, brand-clear, and honest about incomplete chess coverage (`app/page.tsx`, `EarlyBuildBanner`, footer).

- Event pages separate organizer registration from Causey RSVP/save; unsigned users can still register externally.
- Join/claim landings give a clear next action before forcing a blank login.
- Design system / anti-vibecode is largely followed on core discovery.

Not done properly

- SEO metadata in `app/layout.tsx` sounds finished (“shown clearly”) without incompleteness caveats.
- Hero source line understates live ingestion sources.
- `/sources/state-affiliates` (`app/sources/state-affiliates/page.tsx`) uses “Coming soon” above the H1 (banned pattern).
- Home conversion pitches student/parent only; coach is buried; no district/school buyer path (`HomeAccountPitch`).

Set up but shouldn't be (or shouldn't look finished)

- Non-chess “Soon” chips and affiliate “coming soon” read like product promises.
- Stale `README.md` still claims no accounts, no auth, no student PII, no admin UI — dangerous if used in sales/ops.

Missing for for-profit district sale

- No `/pricing`, `/privacy`, `/terms`, `/security`, FERPA/COPPA disclosure, contact/demo, or district pitch.
- Signup collects student DOB with no privacy/data-practices link.
- No “Book a meeting” / pilot CTA for institutional buyers.
- Commercial packaging undecided (noted in `.cursor/district-ux-progress.md`).

2 Student (/me)

Done properly

- Mission ladder: parent-link → RSVP/registration → join club → search.
- Clubs via join code; leave org; plan Upcoming/Past; Alerts inbox; `/account` hub.
- Post-login lands on `/me`.

Not done properly

- Join preview failures can still look like a real invite before reject (`/join/[code]`) — open P1.
- “Past” is self-reported plans, not attendance.
- Leave-club only on org page (account leave = Pilot backlog).

Premature / confusing

- Alert prefs for email/guardian that are explicitly not wired — honest copy, still looks like a working product setting.

Needed

- Product email for invites/reminders.
- Visible privacy practices; account delete/export (Legal).
- Cleaner leave-club + parent-revoke from account.

3 Parent (/family)

Done properly

- Strongest role UX: one desk, multi-child priority, RSVP + unfinished organizer-registration inbox, link/unlink child.
- Non-parents redirected away from /family.

Not done properly

- First-child setup: “Create a student account” while parent is already signed in creates session/credential ambiguity (open P1).
- No true per-child reminder delivery beyond visit-time attention + Family inbox.

Premature

- Guardian-routing toggle saved but “not wired.”

Needed

- Product email + real guardian routing.
- Privacy for minor data.
- Device-handoff / magic-link child account creation without “sign out and make another account” confusion.

4 Coach / staff (/orgs)

Done properly

- Empty-org → invite students before create; org mission (draft → manage → invite → create).
- Roster/groups, tournament create/draft/preview/publish, manage invites/RSVP/attendance, announcements.
- Claim-link staff onboarding without destroying student/parent persona.

Not done properly

- Assistant coach $\approx$ full coach via collapsed staff helpers (`lib/org-permissions.ts isOrgCoach` includes `assistant_coach ... district_admin`).
- Roster/manage still feel like admin tables, not school-safe tools.
- Header stays discovery-thin for day-to-day coaching.

Premature / risky

- “Create tournament anyway” escape hatch can skip the invite-first path.
- Signup “Coach / Organizer” implies institutional power; districts are platform-provisioned only (copy on org create is better than marketing).

Needed

- Assistant-coach permission matrix.
- Product email for student/staff invites (manual claim/CSV today is pilot-OK, not SaaS-OK).
- Results/history after events (Roadmap).

5 School / org admin (membership on /orgs/[slug])

Done properly

- People: join-link vs. claim-invite, reissue/copy, bulk claim CSV (`OrganizationPeopleManager`).
- Settings: rename, ownership transfer, verification status.
- Reports: season attendance.
- School-admin handoff from district (`?setup=school-admin`).

Not done properly

- Overview still reads as coaching workspace more than staffing/settings-first school administration.
- Ops depend on copying claim links by hand — fine for assisted pilot, weak for purchase.

Premature

- Alert preference UI that implies institutional delivery.
- README contradicting shipped accounts/admin.

Needed

- Distinct school-admin mission (staff $\rightarrow$ settings $\rightarrow$ exports first).
- Org export/offboarding; production invite email; privacy for roster data.
- Soft boundaries vs. assistants.

6 District admin (district org on /orgs/[slug])

Done properly

- Pilot readiness command center (`lib/district-readiness.ts`): verify → create school → invite admin → claim → transfer → provision → report.
- No district student roster/join (correct lifecycle).
- Aggregate reporting without browsing PII.
- Platform verification + bulk school verify (0034).
- Assisted truth documented in `docs/district-pilot-runbook.md`.

Not done properly

- No district-scale IA — same narrow org column + coach-class header; no dedicated district home route.
- Personal home path ignores district context (lands like a coach on /orgs).
- Reporting is on-screen only (no CSV export of aggregates).
- Readiness copy correctly admits email is off — that admission is also a sales blocker.

Premature

- Treating district as “another org” in the coach shell without a district buyer/operator chrome.

Needed for for-profit

- District-scale multi-school dashboard + nav.
- Product email for school-admin claims and family reminders.
- Report exports / richer rollups.
- Buyer journey + packaging (owner decision).
- Legal agreements for student data.
- Self-serve district signup is not required for first paid pilots (platform provision is correct); it is required for scalable SaaS checkout later.

7 Platform admin (/admin)

Done properly

- Separate moderation shell: moderation-first home, tournaments (drafts/publish/scrape), organizations (create districts, verification queue, bulk verify), users (search + role/platform-admin changes).
- District creation reserved for platform (not coaches).

Not done properly

- No direct “assign org membership role” from user directory (support still handoff-incomplete).
- Silent bounce to / if non-admin hits /admin (secure; confusing for mistaken ops).

Premature

- N/A for sale — this is internal ops. Keep it.

Needed

- Migration application discipline on every environment (runbook warns duplicate 0015/0016 prefixes).
- Ops docs that match product (README cleanup).

8 Cross-cutting: what “district-ready for profit” actually means here

Bar	Status
Assisted chess pilot (you provision, manual claim links, email off)	Mostly ready
Trustworthy minor-data product	Not ready (DOB, no privacy/terms)
Sellable public storefront	Not ready (no pricing/demo/district pitch)
Self-serve district SaaS	Not ready (by design today; correct for pilot)
Role permission clarity	Partial (DB ahead of UI; assistant $\approx$ coach)
Notifications that matter	In-app only; visit-time reminders; no product email

9 Highest-impact fix order (if you implement next)

1. **Legal/trust storefront:** privacy + terms + honest student-data practices; fix README; link from signup/footer. (Owner/legal required for final language.)
2. **Institutional buyer path:** home/district pitch + contact/demo CTA; packaging decision (do not invent prices in code).
3. **Product email:** invites, claim links, deadline/reminder delivery + guardian routing.
4. **Real role split in UI:** assistant vs. coach vs. school_admin vs. district_admin missions and permissions.
5. **District-scale IA:** multi-school shell beyond single-org column; school-admin-first overview.
6. **Polish leftovers:** join-code fail-closed preview; parent→child account handoff; empty/error “what’s next” consistency; report CSV export.

This audit is observational only — no code changes until you pick which layer to ship first.
